## **DETAILED ACTION**

### ***Allowable Subject Matter***

1. Claims 45-65 are allowed.
2. The following is an examiner's statement of reasons for allowance: this application was previously allowed by the Notice of Allowability mailed on February 22, 2010 and the Notice of Allowability mailed on July 26, 2010. Subsequent to the latter Notice of Allowability, Applicant submitted a Request for Continued Examination and one Information Disclosure Statement. Applicant has not amended the claims or added claims since the last Notice of Allowability. Although the European Search Report for Application No. EP 09177290, which is part of the new Information Disclosure Statement, lists a number of "X" references none of the references cited in the new Information Disclosure Statement anticipates or renders obvious the claimed invention. In particular,  
  
US 4,337,279 is for a method for increasing the peel strength of metal-clad polymers. Its application is "For example, circuit boards ...used in telephonic or video equipment." The "... invention relates to a method for increasing the peel strength of metal-clad polymers." See the title and col. 01:01-34. There is no

Art Unit: 1795

mention of biosensors, more especially a biosensor with electrodes, in US 4,337,279, nor do Applicant's claims mention polymer peeling.

US 4,310,614 is for a method and apparatus for pretreating and depositing thin films on substrates. The Summary of the Invention states, "According to this invention, a method and apparatus is devised wherein thin films, such a, tellurium films of thicknesses less than 150 Å, may be easily deposited ..." See the title and col. 01:54-62. There is no mention of biosensors, more especially a biosensor with electrodes, in US 4,310,614. US 4,310,614 discloses greatly improved adhesiveness and abrasive resistance for the thin film deposited by their method "... rendering it useful as an optical recording medium with excellent archival properties."

US 5,487,810 is for a process for pretreating surfaces of plastic items: "The present invention provides a process for pretreating surfaces of plastic items in a low-pressure plasma for subsequent application of layers, especially metallic layers, ..." See the title and col. 01:01-10. There is no mention of biosensors, more especially a biosensor with electrodes, in US 5,487,810. US 5,487,810 states, "Suitable plastic items which may be pretreated by the process according to the invention are, for example, plates, reflectors for car headlights and moulded items of any type or dimension, e.g. housings and equipment and films for packaging purposes."

EP 0573101 B1 is for an ion selective electrode and method of manufacture:

“The present invention relates to a method of producing an ion selective electrode, in particular ion selective electrodes having Ag/Ni deposited films.”

See the title and col. 01:01-05. At the least, EP 0573101 B1 does not anticipate the claimed invention because there is no disclosure of a first type of slits and a second type of slits as claimed.

US 4,444,848 is for adherent metal coatings on rubber-modified epoxy resin surfaces: “This invention relates to the manufacture of adherent metal coatings on polymer surfaces and more particularly to the formation of such coatings on epoxy surfaces.” US 4,444,848 does not mention of biosensors, more especially a biosensor with electrodes. The coatings can be used "... in printed circuit boards in the electronics, telecommunications, computer and other industries for creating conductive “paths on interconnector devices, or it may be used merely as a radio interference barrier. Such coatings also have applications in the manufacture of certain types of credit cards, video disks and for decorative coatings.” See the title and col. 01:01-23.

Art Unit: 1795

US 5,407,867 is for a method of forming a thin film on surface of semiconductor substrate: "The present invention relates to a method of and an apparatus for forming a thin film on a surface of a semiconductor substrate and, more particularly, to a method of an apparatus for forming a thin film in which an interface structure between the semiconductor substrate and the thin film is reliably controlled." See the title and col. 01:09-16. US 5,407,867 does not mention of biosensors, more especially a biosensor with electrodes.

It should be noted that the European Examiner's rejections appended to the Search Reports appear to address claim limitations other than those in the instant application. They also do not mention a first type of slits and a second type of slits as claimed. Thus, the claims are still allowable as deemed previously.
